17;

The present invention provides the protein and coding sequences of cDNAs isolated from human, murine and rat skin cell libraries. The sequences can be used in the development of therapeutic agents useful in the treatment of skin diseases, including skin wounds, cancer, growth defects, developmental defects and inflammatory diseases. The proteins have important roles in the induction of hair growth, cell proliferation healing and in modulating immune responses. The present sequence is a polypeptide of the invention

Sequence 819 AA;

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences genomic DNA sequences (ABL16176-ABL36511), expressed DNA sequences (ABL16175) and the encoded proteins (ABBS7737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     3444 EBPLALNEWHTVRVSRFKRDGYIQVDEQHPVAFPTLQQIPQLDLIEDLYIGGVPNWELLP 3503

                                                                       The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and insecticides, therapeuticy and pharaceutical furge. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence date for this patent dd not form part of the printed specification, but was obtained in electronic form part of the from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 957 EYGDAMAASQVPLAFEDASPGTPRSSDNNEDDENAFVRDESLFDASDGTEEYQRKQLAQD 1016

                                                                                                                                                                       This polypeptide comparises the amino acid sequence of human agrin deduced from an isolated foetal brain cDNA clone (see AR79041). Pull-length agrin, or active portions of it, can be expressed using a claimed host-vector system. The agrin polypeptides can be used in claimed methods treating diseases or disorders that affect muscle, especially atrophy resulting from denervation due to nerve trauma, degenerative, metabolic or inflammatory neuropathy, peripheral neuropathy or damage to nerves caused by environmental toxins or drugs. In particular the muscle atrophy is due to motor neuronopathy, chronic disuse, metabolic stress or nutritional insufficiency, muscular dystrophy syndrome, congenital myopathy or acquired (toxic or inflammatory) myopathy. The polypeptides can also be used in a claimed method of promoting the growth, if elecantiation or survival of cells that express muscle-specific (MuSK) receptors (see AAM26610-11), and to raise antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           18;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               529

Human, pharmaceutical, diagnostic, gene therapy, tissue regeneration, cell regeneration, membrane protein, signal transduction-related protein, transcription-related protein, osteoporosis, neurological disease,

cancer; tumour Homo sapiens. EP1308459-A2 37-MAY-2003.

The invention relates to new isolated NOVX polypeptides, the genes encoding them or sequences having at least 95% identity to the amino acid or nucleotide sequences. The NOVX polypeptide is useful as a therapeutic, particularly in the manufacture of a medicament for treating a syndrome associated with a human disease, which includes a pathology associated with NoVX polypeptide is particularly useful for treating, preventing or alleviating pathology associated with NOVX polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and polypeptide in a mammal, e.g. a human. The NOVX nucleic acid and inabetes, obesity, cancers (e.g. lymphoma, uterus cancer or prostate cancer), dyslipidemias, anorexia, wasting disorders, Alzheimer's disease, parkinson's disorder, cachesta, cardiomyopathy, AIDS, asthma, Crohn's parkinson's disorder, cachesta, cardiomyopathy, AIDS, asthma, Crohn's graft-versus-host disease or Albright hereditary osteodystrophy. The DNA encoding the protein is useful in gene therapy for treating the above conditions. These are also useful in developing powerful assay system for functional analysis of various human disorders, as well as in diagnostic applications. This sequence represents one of the NOVX proteins of the invention.

The invention discloses a polymuclectide comprising a sequence selected from 1970 fully defined nuclectide sequences which encode novel polypeptides. Also claimed is a polypeptide encoded by the polymuclectide or its patrial peptide, an antibody binding to the polypeptide or peptide of the polymuclectide, immunologically assaying the polypeptide or peptide with the antibody of the encoded by contacting the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two, a transformant carrying the polymuclectide in an expressible manner and an antisense polymuclectide. The oligonuclectide is useful as a primer for synthesishing the polymuclectide, or as a probe for detecting the polymuclectide. The polymuclectide and encoded genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of genes may be more are involved in tissue and/or cell captacine, are involved in tissue and/or cell captacine, and penes are involved in tissue and/or cell captacine, as a probe an expression. Membrane proteins, disease-related proteins, transcription related proteins, disease-related proteins and genes and manner plans and activity, or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an encoder and activity or an neurological diseases, cancer, tumours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is a protein of the invention. Note: Some of the sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. New polynucleotides and polypeptides, useful for developing a diagnostic marker or medicines for regulation of their expression and activity, or encoding them can be used as indicators for diseases (e.g. osfeoporosis, neurological diseases, cancer, tumours. The CDNA may be used to regulate Otsuki T, Wakamatsu A, Sato H, Isl Hio Y, Otsuka K, Nagai K, Irie R, Otsuka M, Nagahari K, Masuho Y; Claim 1; Page; 222pp; English. as targets of gene therapy Query Match Best Local Similarity 28.74 Matches 162; Conservative Sugiyama T, J, Isono Y, Y 2003-450961/43 N-PSDB; ADB62934. Albang H., Li X.-J., Martin D.B., Aebersold R.;

Identification and quantification of N-linked glycoproteins using hydrazide chemistry, stable isotope labeling and mass spectrometry.";

Nat. Blotechnol. 21:660-666(2003).

-! FUNCTION: This protein is an integral component of basement membranes. It is responsible for the fixed negative electrostatic charge and is involved in the charge-selective ultrafiltration properties. It serves as an attachment substrate for cells.

-!-SUBDNIT: Purified perlecan has a strong tendency to aggregate in dimers or stellate structures. It interacts with other basement membrane components such as laminin, prolargin and collagen type
                                                                                                           [6] SEQUENCE OF 1-21 FROM N.A. SEQUENCE OF 1-21 FROM N.A. -!- TISSUE SPECIFICITY: Found in the basement membranes.
-!- PTM: CONTAINS THREE HEPARAN SULFATE CHAINS AS WELL AS N-LINKED AND O-LINKED OLIGOSACCHARIDES.
-!- SIMILARITY: Contains 4 LDL-receptor class A domains.
-!- SIMILARITY: Contains 11 laminin EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi, Mammalia, Eutheria, Rodentia, Sciurognathi, Muridae, Musinae, Mus

Durbin R.;

Submitted (FEB-1998) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Probable role in myofilament assembly and/or attachment of the myofilament lattice to the cell membrane. May be an extracellular anchor for integrin receptors in muscle.

-!- SUBCELULAR LOCATION: Extracellular matrix.

-!- ALTERNATIVE PRODUCTS:

EVENT ENDING PRODUCTS:

-!- TISSUB SPECIFICITY: Embryonic nervous system and muscle.
-!- DEVELOPMENTAL SAGGE: More abundant early in development.
-!- DTM: Contains heparan sulfate chains as well as N-linked and O-linked oligosaccharides (By similarity).
-!- SIMILARITY: Contains 9 Kazal-like domains.
-!- SIMILARITY: Contains 2 laminin EGF-like domains.
-!- SIMILARITY: Contains 4 EGF-like domains.
-!- SIMILARITY: Contains 3 laminin G-like domains.
-!- SIMILARITY: Contains 3 laminin G-like domains.
-!- SIMILARITY: Contains 4 EGF-like domains.
-!- SIMILARITY: Contains 3 laminin G-like domains.
junction.
-!- ALTERNATIVE PRODUCTS:
    Event-Alternative splicing; Named isoforms=5;
    Comment=Additional isoforms seem to exist. Isoforms differ their acetylcholine receptor clustering activity;

Cell 96:795-806(1999).
C. I. FUNCTION: Plays a xrole in axon guidance as a repulsive ligand for ceptors preventing inappropriate midline crossing.
C. I. SUBGRILULAR LOCATION: Secreted. The Cterminal cleavage protein is more diffusible than the larger N-terminal protein that is more tightly cell associated.
C. I. ALTERNATIVE PRODUCTS:

The genome sequence of Drosophila melanogaster ", "

Rocience 287:2185-2195 (2000).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -1. SUBCELLULAR LOCATION: Integral membrane protein.
-1. SUBCELLULAR LOCATION: In the pupal wing, expressed at relatively
even levels in all regions. Abundant in 6-9 hour embryos.

EXPLESSED at higher levels in pupae than larvae.

EXPLESSED at higher levels in pupae than larvae.

-1. DEVELOPMENTAL STAGE: At 12 hours after puparium formation (apf),
expressed evenly at cell boundaries. By 30 hours apf, expression
is concentrated at proximal and distal cell boundaries with little
or no expression at anterior and posterior boundaries with little
or no expression at anterior and posterior boundaries. When
prehairs emerge at 30-36 hours apf, expression becomes evenly
distributed again along the whole cell boundary.

-1. SIMILARITY: Contains 8 cadherin domains.

-1. SIMILARITY: Contains 2 laminin G-like domains.

-1. SIMILARITY: Contains 1 GPS domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This SWISS-PROT entry is copyright. RT Folinical and molecular study in congenital muscular dystrophy with partial laminin alpha-2 (LAMA2) deficiency.";

RT Full Mutat. 21:103-111(2003).

LI FUNCTION: Binding to cells via a high affinity receptor, laminin of the complex to mediate the attachment, migration and organization of cells into tisques during embryonic development by interacting with other extracellular matrix components.

C. SUBUNIT: Laminin is a complex glycoprotein, consisting of three different polypeptide chains (alpha, beta, gamma), which are bound to cach othyreptide chains (alpha, beta, gamma), which are bound to cach other by disulfide bonds into a cross-shaped molecule components.

C. SUBUNIT: Laminin is a subunit of laminin-2 (merosin) and laminin-4 (S-merosin).

C. SUBLILIULAR LOCATION: Extracellular; found in the basement membranes (major component subone, stringle persist and some other regions of the brain; not in liver, thymus and bone.

C. TISSUE SPECIFICITY: Placenta, striated muscle, peripheral nerve, cardiac muscle, panceres, lung, spleen, kinche consent the brain; not in liver, thymus and some other regions of skin, testis, meninges, chrocid placus, and some other regions of skin, testis, meninges, chrocid placus, and some other regions of strin, tother laminin chains to form a coiled coil structure.

C. DOMAIN: Domains VI, IV and G are globular.

C. DOMAIN: Domains VI, IV and G are globular.

C. DOMAINSITY: Contains 1 laminin N-terminal domains.

C. SIMILARITY: Contains 2 laminin W-tike domains.

C. SIMILARITY: Contains 2 laminin GF-like domains.

C. SIMILARITY: Contains 2 laminin GF-like domains.

                                                                                                                                                                                                                                                                                   1 Subunity: The laminin G-like domain 2 binds to neurexophilin 1.

1 Soforms alpha 4B bind to alpha-dystroglycan. The cytoplasmic C-
terminal region binds to CASK.

1 SubcELLUIAR LOCATION: Type In membrane protein (Potential). Some
isoforms seems to be secreted.

1 ALTERNATIVE RROUGTS:

Comment=Alternative splicing; Named isoforms=1;
Comment=At least 288 isoforms may be produced by alternative
splicing: There is a combination of five alternative splicing: There is a combination of five alternative spliced
domains at sites 1, 3, 4 and 5, each consisting of modular
sequences (A-L) that seem to be used independently. Isoforms
Splicing: There is a combination of five alternative spliced
commains at sites 1, 3, 4 and 5, each independently. Isoforms
Splicing: There is a combination of five the transmembrane domain;

-!- FUNCTION: Neuronal cell surface protein that may be involved in cell recognition and cell adhesion. May mediate intracellular signaling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       InterPro; IPRO0095; Asx hydroxyl S.

"Prediction of the coding sequences of unidentified human genes. VI.
The coding sequences of 80 new genes (KRAA0201-KIAA0280)

analysis of CDNA clones from cell line KG-1 and brain.";

DNA Res. 3:321-329(1996).

-!- FUNCTION: Receptor that may have an important role in cell/cell signaling during nervous system formation.

-!- SUBCELLULAR LOCATION: Integral membrane protein.

-!- TISSUE SPECIFICITY: Highest expression in brain and testis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Bukaryoča, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
